

La Tanda

Rotating savings + low-cost USDC remittances
for the underbanked in Latin America

Building the cross-border remittance rail on Stellar

latanda.online · Ray-Banks LLC · SCF #45 — Integration Track

THE PROBLEM

Sending money home is expensive. Receiving it is harder.

- LatAm remittances are a huge, high-fee market — **often 5–10%+ per transfer**
- Recipients are largely **unbanked** — savings and credit are informal and unprotected
- The systems families already trust — **tandas**, rotating savings circles — have **no digital rails and no protection**

Not a concept — a live product with real money moving through it

BONDED VALIDATORS · OWN CHAIN

- **Live product:** on-chain tandas + marketplace + AI assistant — ~2.5M blocks · 3 gov proposals passed
- Pre-revenue · pre-seed · testnet → mainnet

The corridor is an **integration**, not an invention

- **CCTP (Circle Cross-Chain Transfer Protocol)** — brings **native USDC** into the corridor via burn-and-mint (Noble → Stellar). The dollars' on-ramp.
- **Stellar Disbursement Platform (SDP)** — bulk payout engine that fits the tanda's payout mechanic exactly: each cycle's distribution is a disbursement.
- **LATAM off-ramp (Bridge)** — the last mile: USDC → lempiras, cash-out for the unbanked recipient in Honduras.
- **Non-custodial** — La Tanda never holds user funds; the regulated fiat leg is the licensed off-ramp partner.

Ecosystem tailwind: native USDC + MoneyGram's MGUSD now issued on Stellar confirm USDC as the settlement asset — but the integrated building blocks are CCTP + SDP + off-ramp.

Three Stellar building blocks, orchestrated into one corridor

- The open-source **Soroban “Corridor Escrow”** is the non-custodial glue that coordinates the three blocks — [already deployed & working on testnet](#) (lock→release verifiable on stellar.expert).
- Corridor: **US → Honduras, direct** — the home market, where the ~86 users already are.
- Repo: github.com/INDIGOAZUL/latanda-stellar-corridor (Apache-2.0)

\$145,000 in XLM — milestone-gated, ~6-month build

TRANCHE	%	DELIVERABLE
#0 — Acceptance	10%	KYC/KYB, public repo + board, testnet + CCTP env, off-ramp onboarding started
#1 — MVP (testnet)	20%	CCTP inbound working + Corridor Escrow v2 orchestrating it + non-custodial USDC wallet
#2 — Testnet expansion	30%	SDP bulk payout + Bridge off-ramp + Cosmos↔Stellar indexer + full recorded corridor demo
#3 — Mainnet	40%	Mainnet launch + Honduras cohort + escrow/integration open-sourced + bilingual docs

100% engineering. The **integration** (CCTP + SDP + off-ramp) is the majority of the budget; the escrow is the orchestrator, not the largest line.

The savings + remittance layer for LatAm's underbanked, settled on Stellar

- **Narjell Ebanks** — Founder / lead engineer (Honduras) · **Fredi Romero García** — Co-Founder & US Ops Liaison ([team of record](#))
- Infra & validator contributors (UTSA) + CLA-signed contributors — IP assigned to La Tanda
- Live network, real infra partners, **honest numbers**
- **latanda.online** · github.com/INDIGOAZUL/latanda-stellar-corridor · Demo (~2:52): youtu.be/izL3i273vhU — non-custodial escrow live on Stellar testnet
